Report a data**Abstract of WO9957511**

In order to improve the representation of the terrain on a Primary Flight Display and a navigation display, the terrain is represented at least partially in the form of a stratified model of the terrain and/or the representation of at least the lower parts of the terrain are shown in a less showy color, particularly gray. Measures are also disclosed enabling reliable recognition of topographical elevations on the navigation display and producing a sufficiently in-depth representation of the terrain in front of the plane during flights at high altitudes.
